students investigate mock crime scene

The walk down the C-wing stairs filled students with suspense and intrigue as Allison Bouwman's Forensic Science classes hurried to their first crime scene in the lecture hall and L100.

"I was taken aback when we walked into the lecture hall and saw a dead body on the ground," Charlie StevensonTM said. "Seeing the body made me very excited to see what she would be waiting for us in this class."

Having studied the procedures in the weeks prior, students arrived already separated into their different job descriptions. Students formed their own forensics teams, with some students taking the role of lead investigator while others acted as liaisons in charge of responding to media and authority.

Their task was to secure the crime scene in all its integrity and to test their procedural skills.

"I was the bouncer," Huy DoTM said. "It was my job to secure the crime scene. I really enjoyed the sense of authority given me and blocking the hooligans who tried to walk in."

All the students were in groups and all members had to complete their tasks to ensure that nothing in the crime scene became contaminated.

This included taking extensive photographs from every angle ensuring nothing went unnoticed. The investigators also watched out for teachers and students who had been recruited to provide as many distractions as possible.

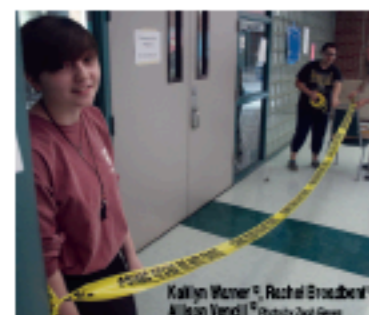

"My job was to mark all the evidence in the room and to create a detailed sketch with measurements," Chinar GandhiTM said. "I had to take all the abstract, vague details and make it clear."

The students analyzed the crime scene and collected evidence in order to find out who killed the victim.

"I liked how realistic it was, but not real enough to be dangerous," Shruti RajagopalTM said. "It was fun putting all the pieces together to solve the crime."

finding your center.

WHAT DO YOU SPEND YOUR TIME ON IN HIGH SCHOOL?

"My swim team is a big part of my time, but getting good grades is really important to me now that I'm in high school and they actually matter.
— mallory craderTM

"Most of my time is spent with friends or reading because books serve as an escape and friends are always good to have around.
— gert reyesTM

"I spend my time in band because I love playing and appreciating music. The friendships we have from spending all our time together are really strong.
— kevin ryanTM

"Robotics and engineering are what I've been mainly involved with. I'm planning to pursue my mechanical engineering experience after I graduate.
— niley woodallTM

"Sleeping and schoolwork take up most of my time. It's hard balancing the two.
— chloe frangenbergTM

"I focus my time on choir. There's so much music to learn and competitions to compete in; it takes a lot of practice.
— samantha barufaldiTM

"I focus a portion of my time on Pre-AP Precalculus because it takes up some time. I like to focus on myself, friends, homework, video games and food.
— eleanor wakouTM

intensive work

Intensity — a comprehensive workshop at Balfour Publishing Co. in Dallas — brought high school yearbook editors together to brainstorm and finalize ideas for the yearbook. While it was a busy work environment, Staffer's improved designs and finalized the theme for the 2015 Maverick yearbook.

"My favorite thing was making an alternative copy design, which is just telling a story in a different perspective," Lila DinhTM said. "We worked and got things finished while also bonding; it was a fun experience."

Up Close and Personal While touring the Balfour plant, Sarah HanTM uses a loupe to see individual colors on a printed signature. "I want to be in high school one more year just to get the opportunity to go back to Intensity," Han said. "I enjoyed working with the other editors to fine-tune our ideas." spotlight

Mixing different chemicals to create heat, Gabby HowellsTM tries not to spill. Howells didn't like chemistry because it involved too much math. "I created light by burning metal with a liquid chemical," Howells said. Certain metals, such as magnesium or iron, gave off light that burned in distinct colors based on the material. This reaction is what makes fireworks possible. Howells liked how when she rotated to each individual station, she had the chance to see how each reaction was different. Photo by John Long
